

## Using BridgeTrak's Evaluation Copy with a Shared Database

To use the BridgeTrak for Windows database in a shared environment requires minimal setup. The Evaluation copy of BridgeTrak for Windows software installs the sample database in the following location:

C:\Program Files\Kemma Software\BridgeTrak70\Database\KSSamp70.mdb

First, copy the BridgeTrak database to a server location. This can be a network server, or a PC with a shared directory.

After you have moved the database to a shared drive you will need to run the Configuration Editor on each PC that needs access to the database. The Configuration Editor can be found in the following location:

C:\Program Files\Kemma Software\Common Files\BT-ConfigEditor\BTConfigEditor.exe

When you run the Configuration Editor you will need to check the box for BridgeTrak for Windows and select your database type (MS Access). Then browse to the location of the database on your shared drive. Finally click Save followed by Close. (See below)
